

# Corten Steel Planter 40

The Corten Steel Planter modular system by Herstera is made from Corten-type steel, a structural steel known for its high mechanical strength and exceptional durability in outdoor conditions. Unlike conventional steel, Corten steel is an alloy that develops a protective surface patina of rust, acting as a barrier against corrosion without the need for additional coatings. Over time, the oxidation process stabilizes, and the protective layer prevents further corrosion, safeguarding the piece from degradation and extending its lifespan.

It is a recyclable material and contains no paint, making it an environmentally friendly choice. This noble material conveys a natural warmth that evolves with time. Without the need for enamels, it adapts to its surroundings and withstands even the most demanding conditions — an ideal choice to bring character to landscaping projects, urban design, and contemporary architecture.

## Series Connection

By connecting the planters together using Herstera's series connector, the structure is reinforced and free from internal walls, promoting the natural growth of roots.

## Base

The planters include a base with drainage holes to prevent waterlogging. The adjustable feet included make it easy to level the planter on uneven surfaces, ensuring stability and proper drainage.

## Wheels and Legs

Compatible with Herstera's stainless steel legs and wheel accessories, which make it easier to move and elevate the planter.

## Lighting Options

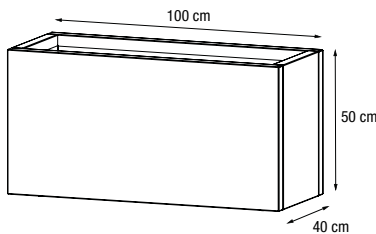

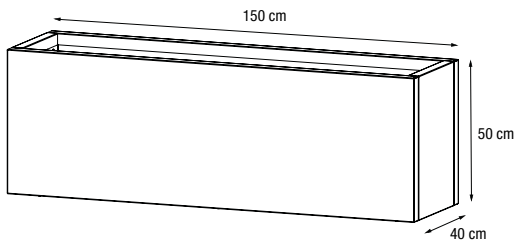

Compatible with Herstera's light support and magnetic LED strips, allowing the front of the planter to be illuminated with warm, indirect light, creating an elegant and immersive visual effect.

## Inner Protection

We recommend using a layer of geotextile felt, such as Herstera's felt bags, to ensure proper drainage and filter outgoing water.

Corten steel products are delivered unoxidized, with a dark gray tone that gradually develops into a protective rust patina. The beauty of Corten steel lies in its uniqueness — each piece is distinct, unrepeatable, and special, with natural variations in its finish due to the oxidation process. For an immediate oxidized finish, a recommended rust accelerator can be applied, achieving the desired result within two weeks.

## Available Models

## Delivered product finish

Unoxidized corten type steel

## Finishes and Materials

<b>Material</b>	Acero tipo Corten
<b>Thickness</b>	1.5 mm
<b>Hardware</b>	Acero Inoxidable
<b>Finish</b>	Unoxidized corten type steel

## General Specifications
